

1. Client Kickoff/Requirements Gathering Meeting

This will be the first meeting you have after the client has agreed to work with you on a project. The purpose of this meeting is to gather details about the project to ultimately fill out the project brief:

Project Brief

Project information

- Client/organization name:
- Client point of contact:
- Student team members:
- Kickoff date:
- Preferred communication method for client:

Business context

- What does the client/organization do?
- What problem are we solving?
- Who experiences this problem?
- How is the problem handled today?

Goals and success

- What outcome does the client want?
- How will we know the project was successful?

Requested scope

Must-have requirements:

-

Nice-to-have requests:

-

Explicitly out of scope

-

Existing resources

- Existing website/application/codebase:
- Branding/logo:
- Style guide:
- Content/data/assets:
- Hosting/domain/accounts:
- APIs/services/integrations:
- Other resources:

Open questions

-

Next client checkpoint

- Date/target:
- What we plan to show/confirm:

2. Planning Phase

In this phase you need to plan your project before coding. You need to show the instructors the following before starting work:

1. README with User Stories based on the client meeting
2. Trello Board for planning tasks
3. Filled in Project Brief: [Like so](#)
4. Sent the client the Statement of Work (SOW): [Like so](#)
5. ERD
6. Create a google drive folder like so: [Like so](#)
7. Wireframes (Optional)

3. Building

This is where we get to writing the program. You need to decide how to split the work between you and your teammates. Each day we will do morning standups with your instructors but you should hold internal standups in the afternoon

Bahrain Legal Compliance Checklist:

I have also included the Bahrain compliance laws below from my reading. You should also check for your specific sector what is required by Bahrain Law. **IMPORTANT:** This is not the list of all the laws needed to launch a website but it's a starting point of the important things that you will definitely need to have before launching.

- You need a footer with the following:
 - Business Name
 - Contact email, phone number, address (if applicable)
 - privacy policy
 - terms and conditions
 - refund policy (if you are selling things)
- If you are taking in data from the user you **must** have a privacy policy clearly stating
 - What data you are taking
 - How you are using it
 - How long it will be stored
 - How the user can contact you to remove their data from the website

- If you are selling then checkout **must** show:
 - full price, fees, delivery, refund terms, and contact details.
- If you are selling then you need a clear return policy stated on your website
- If you are selling keep very clear invoices including the following:
 - Invoice/order number
 - Transaction date
 - Customer
 - Items/services
 - Quantity
 - Price
 - Discount
 - VAT where applicable
 - Total
 - Payment state
 - Refund state
- Use security Best Practices we saw in class to not expose any sensitive information **Especially** those related to the user
- If you take payments from the user then log every detail of the payment:
 - Date
 - Order number
 - Customer name
 - Product/service
 - Amount excluding VAT
 - VAT amount, if registered
 - Total amount
 - Payment method
 - Gateway transaction ID
 - Refund status
 - Invoice/receipt number
- Arabic to English Translation is a bonus (Though legally if you are selling we are required to have items displayed clearly in Arabic)
- Use security Best Practices we saw in class to not expose any sensitive information **Especially** those related to the user
- All the information needs to be accurate and clear. If the user is purchasing anything the process needs to be clear and unambiguous
- Do not mention VAT unless you are VAT registered. VAT is collected for companies if they are making more than 37,500BD in a 12 month period

4. Checkpoint

After 1 week of the project you should hold a meeting with the merged code in the main and see the progress so far. We should be aiming for MVP by end of week 1

5. User Testing

The team needs to go outside of the dev team and gather feedback about the project. Document the feedback and issues the user highlighted. The team should make at least one evidence-based decision in response to feedback.

document the feedback they give you like so:

- Date of the test
- Feedback or Issue highlighted/ Priority of the issue/ Decision on what to do (Implement or Decline)
- Changes made because of feedback
- Feedback intentionally not implemented

6. Presentation

After you finish the work and have a working MVP prototype, create slides for the presentation. Include a slide that contains the client logo and General Assembly Logo.
